MINIATURE LINEAR GUIDE SERIES MR

About us

The Chieftek Precision Co.,Ltd (abbreviated as **cpc**) place emphasis on recruiting talents with both technique and character. The core team continuously develop the high-quality key components of linear motion devices, system module and control module. The top goal of **cpc** is to provide the products with highest quality and latest technology to help our client to transfer from era of industrial production into smart manufacturing.

Angelika Chen
CHAIRPERSON & CEO

Anton Hsu
PRESIDENT

At early stage, the main focus of the **cpc** was on miniature linear guide, which is majorly applied on precision measurement, electronics industry, automation and semi-conductor semiconductor equipment. We account for high market share in medical industry and have received compliments, and well recognized by worldwide customers.

With the growth and innovation of **cpc**, we are able to supply linear guides with all sizes. Meanwhile to fulfill the demand of market, **cpc** successfully developed the linear motor with high thrust density and efficacy, as well as the DD motor with highest torque efficiency. Besides, to enhance the performance of customer's machine, we further developed the AC, DC driver, magnetic encoder...etc. **cpc** is now a key supplier of mechanics, electronics and control module in industry related to linear and rotary motion. We will keep optimizing and innovating our manufacturing process, elevating the production capacity meanwhile to reduce the defect rate and production cost. The goal of our technology development is to fulfill the demand of customer, provide the product with high quality, high reliability and high added value, to help the customer to build an industry with smart manufacturing.

Time line of major developments

1998 Established

2000 Official production of the MR size 5~15 Miniature Guide Series

2004 Extension into size 3 and 2 miniature linear guide production

2005 Establishment of factory operations in the Tainan Science Park

2007 Production of the ARC/HRC Series Ball Type Standard Size Linear Guides which have achieved ISO 9001:2000 certification

2008 Establishment of **cpc USA** (Chieftek Precision USA Co., Ltd.)
Establishment of **cpc Kunshan**, China (Chieftek Machinery Kunshan Co., Ltd.)
Production of the full range Ironless linear Motor P series

2010 Establishment of **cpc Europa GmbH**
Achievement of ISO 9001:2008 certification

2011 New factory expansion

2013 Wide ball type linear guide production

2014 Achievement of ISO 14001:2000 certification
Achievement of OHSAS 18001:2007 certification
Achievement of CNS 15506:2011 certification
Production of full range Ironcore Linear Motor C Series
Mass production of CLS compact linear Motor Stage Series
Standard 4-Row Roller-type ARR/HRR/LRR Linear Guide Series announced

2015 Mass production of the TC1 AC Linear Motor Servo Driver
Mass production of the CLMS Core Type Linear Motor Stage

2016 MMLS-Linear Motor Stage.
Established CSM Maschinen GmbH.

2017 Passed the ISO9001: 2015 certification.
Passed the ISO14001: 2015 certification.

2018 The establishment of **cpc** factory operations in tree valley park

MINIATURE LINEAR GUIDE SERIES MR

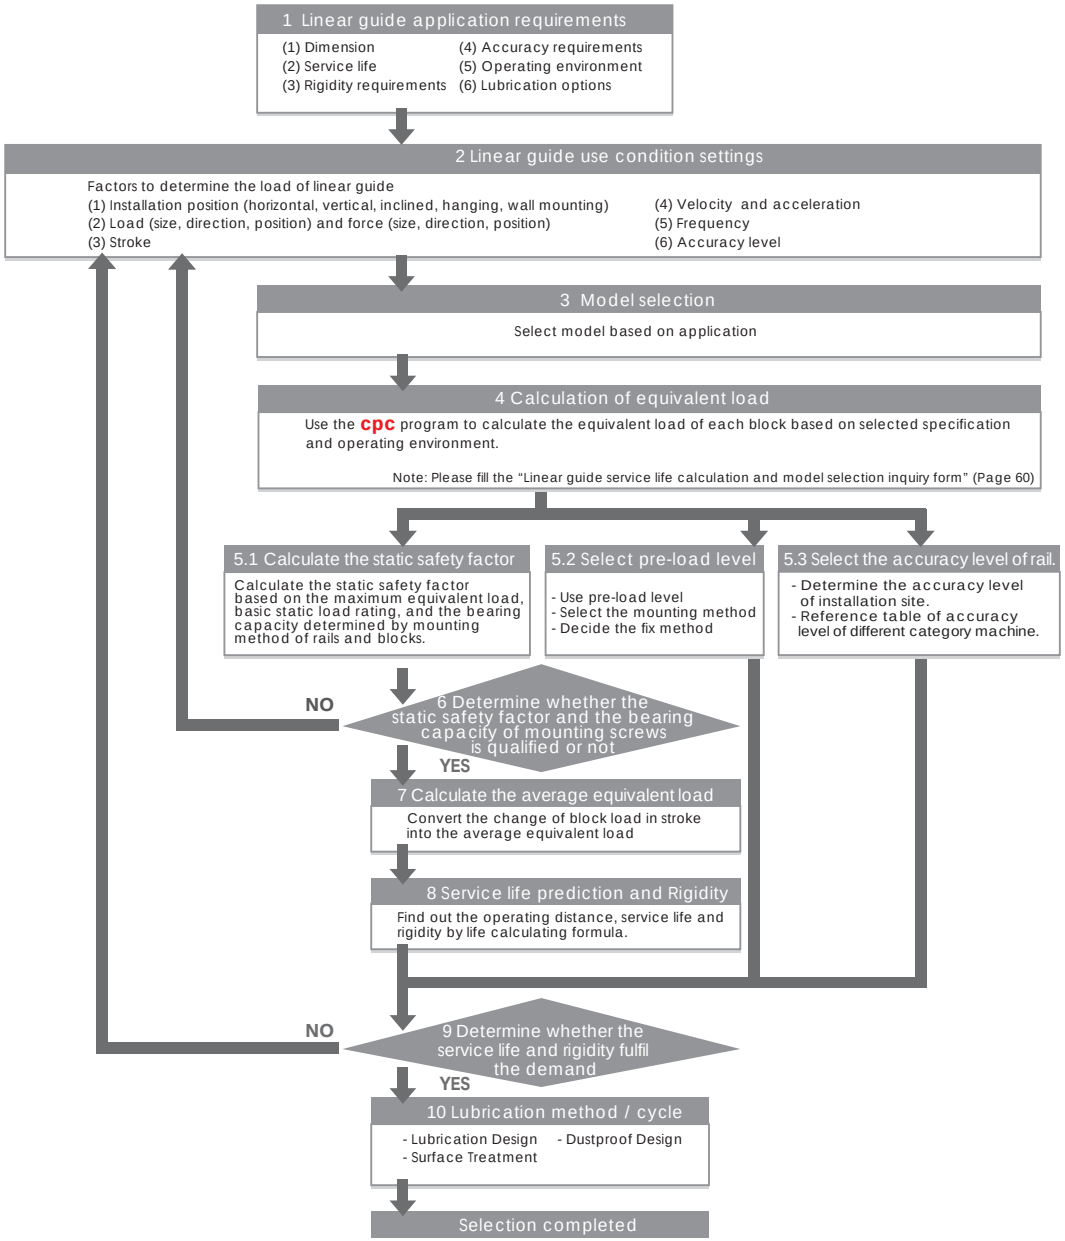
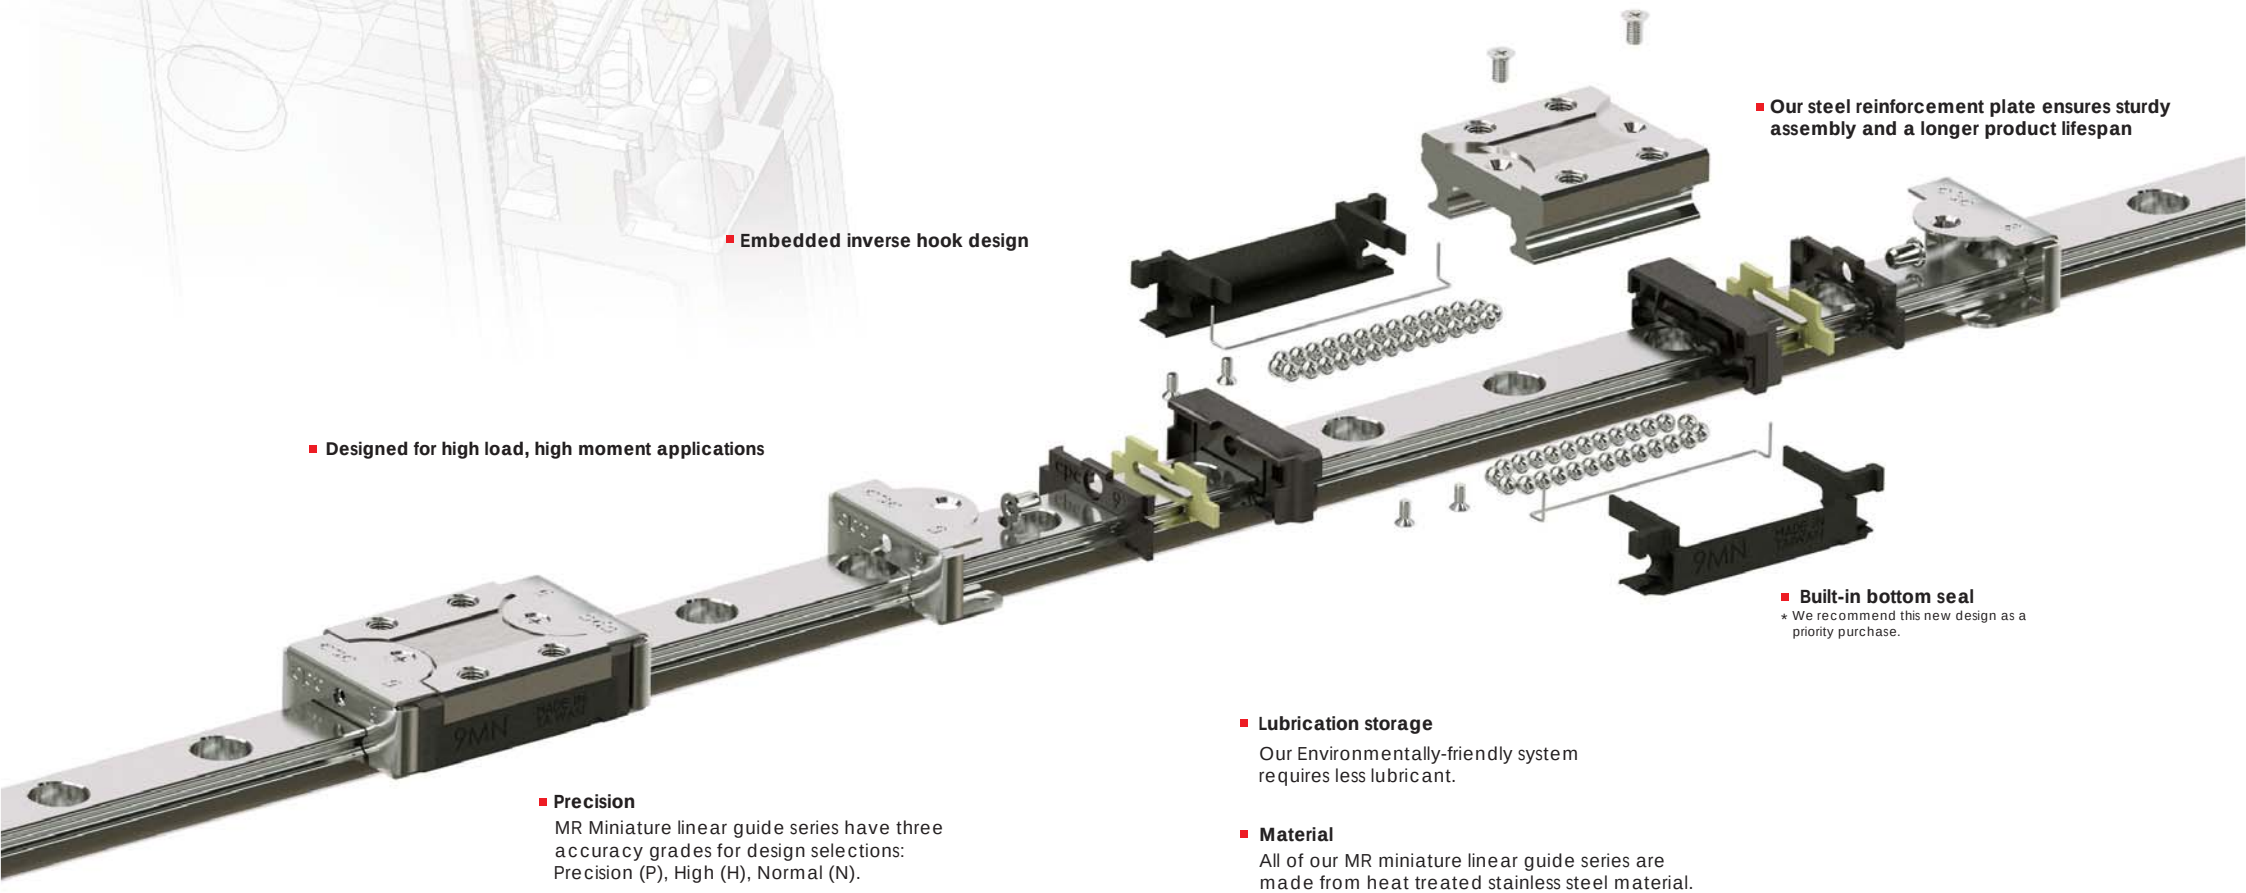
The Flow Chart of Model Selection



MINIATURE LINEAR GUIDE SERIES MR

1. Product Introduction



- **Unique ball re-circulation design**
- **Our steel reinforcement plate ensures sturdy assembly and a longer product lifespan**
- **Embedded inverse hook design**
- **Designed for high load, high moment applications**
- **Built-in bottom seal**
  * We recommend this new design as a priority purchase.

- **Lubrication storage**
  Our Environmentally-friendly system requires less lubricant.

- **Precision**
  MR Miniature linear guide series have three accuracy grades for design selections: Precision (P), High (H), Normal (N).

- **Material**
  All of our MR miniature linear guide series are made from heat treated stainless steel material.

1. Product Introduction

Dustproof design

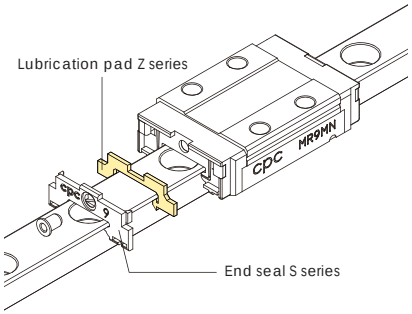
SS series-end seal

The standard end seal design can be hermetically sealed and dustproofed. This extends the product lifespan, reduces lubrication grease consumption, and ensuresa long-lasting lubrication effect. The special seal slip design also ensures a low friction force so as not to affect the product's running smoothness.

Environmentally friendly lubrication design

ZZ series-end seal and lubrication pad

The two ends of the runner block feature a hermetic lubrication grease injection design. This is capable of bringing the lubrication grease to the raceway via continuous steel ball circulation, thereby achieving an effective long-term lubrication effect. A built-in lubrication pad can also be utilized toward prolonging lubrication further for long-term motion, reducing maintenance costs while demonstrating a superior lubrication capability during short stroke motion.



Brand new U series

Features: the built-in bottom seal does not affect the friction resistance if a clearance is smaller than 0.1mm.

SU series - end, bottom seals

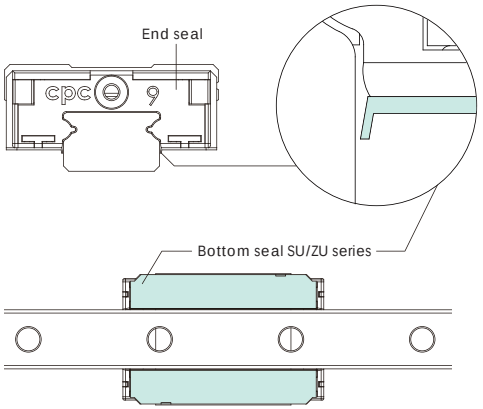
In addition to a normally equipped end seal, our newly designed runner block is equipped with an extra bottom seal. This prevents foreign matter from entering via the lower side of the runner block into the running rail, thereby extending the working life of the runner block

* the new design is recommended for priority purchase.

ZU series - end, bottom seals and lubrication pad

A newly designed bottom seal can prevent lubrication grease from spilling below the runner block. In addition, a built-in mounted lubrication pad further strengthens the series' grease-saving effects while extending its re-greasing interval.

* the new design is recommended for priority purchase.



End reinforcing design

EE series-end seal and reinforcement plate

This series utilizes two stainless steel reinforcement plates to cover the two plastic ends of the slide block completely and stainless steel screws to secure the upper and lower sides of the runner steel block, thereby strengthening the rigidity and increasing the coverage area of the end cap. This ensures faster running speeds while a gap sealing design between the reinforcement plate and slide rail enables an added wiping function

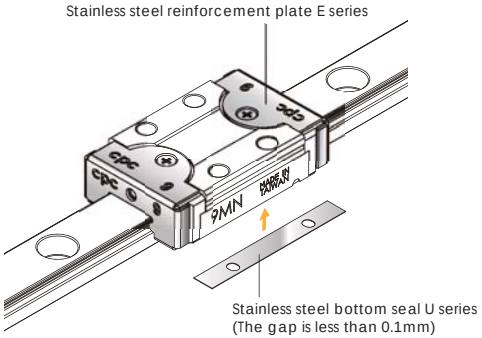
Running speed Vmax=5m/s，amax=300m/s²
(60m/s² can be reached without prepressing)

EZ series - end seal, reinforcing plate and lubrication pad

The built-in lubrication pads at the two ends of the runner block conform to environmental protection requirements and reduce maintenance costs.

EU series - end seal, stainless steel bottom seal and reinforcement plate

The stainless steel bottom seal protects the runner block from unnecessary damage caused by collision with foreign objects. Due to this runner block series having our strongest protective capability, its use is recommended for environments with many iron scraps around.



UZ series - end seal, stainless steel bottom seal, reinforcement plate and lubrication pad

The lubrication pad can provide highly rigid runner blocks with better lubrication and grease storage capabilities, and reduce re-greasing time.

Brand new UE series

SUE series - end seal, bottom seal and reinforcement plate

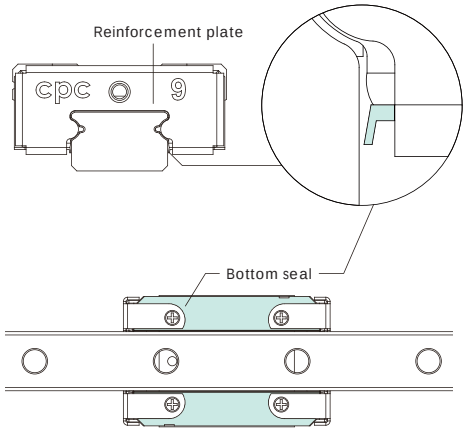
our new design includes an in-built bottom seal. This strengthens the runner block's bottom dustproofing capability while its stainless steel reinforcement plate prevents hard and rigid objects from striking at the plastic cap from the end position. This is why its dustproofing effect is the strongest among all of our product series.

* the new design is recommended for purchase in priority.

ZUE series - end seal, bottom seal, reinforcing plate and lubrication pad

The newly designed bottom seal protects lubrication grease from spilling below the runner block. with our built-in lubrication pad, an additional grease saving effect is attained, further prolonging prolonging our product's re-lubrication timeframe.

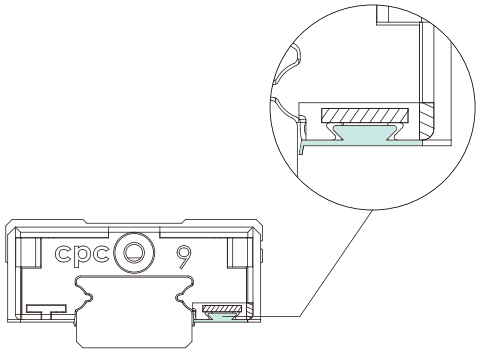
* the new design is recommended for priority purchase.



1. Product Introduction

Embedded inverse hook design for reinforced mechanical integration

When the runner block is in motion and changing direction, the circulating stainless steel balls inside the raceway generate impact force against the plastic end cap. As the demand for rapid motion in the automation industry has increased, **cpc** has invented inverse plastic hooks to tightly secure our miniature blocks by effectively distributing the applied stress over a larger area.

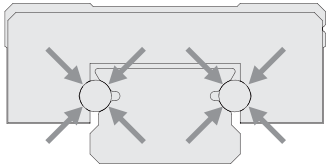


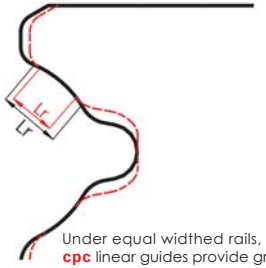
Brand new design

Suitable for :
High speed belt driven mechanisms
High speed carrier designs Automation
linkage between stations

High load and high moment capacity

The MR Miniature Linear Guide Series is designed using two rows of recirculating balls. The design uses a Gothic profile with a 45° contact angle to achieve an equal load capacity in all directions. Within the restriction of limited space, larger stainless steel balls are used to enhance load and torsion resistance capacity.

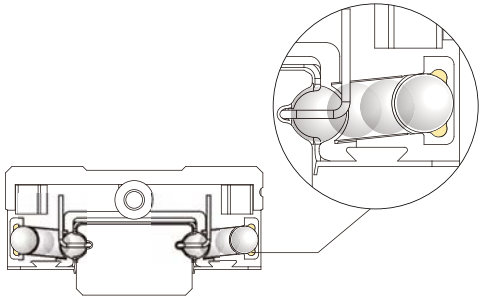




Under equal widthed rails, the black line indicated **cpc** linear guides provide greater surface contact as compared to competing products (indicated with the red-dotted line).

Dust Proof Design

Our standard design comes equipped with an end seal that effectively restricts dust contamination and prolongs lubrication, ensuring longer product life. Our specially-designed low friction seal slips do not affect running smoothness.



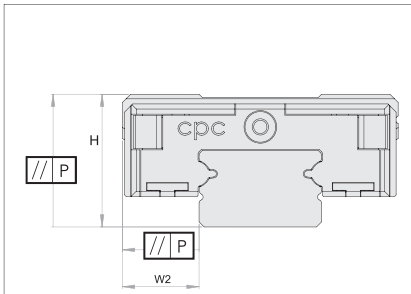
2. Technical Information

2.1 Precision

Accuracy

MR miniature linear guide series have three accuracy grades (P,H,N) for your choice.

Table of accuracy



Accuracy grades (μm)		Precision P	High H	Normal N
Admissible height H dimension Tolerance	H	±10	±20	±40
Height variation for different runner blocks on the same rail position	△H	7	15	25
Admissible width W dimension tolerance	W_2	±15	±25	±40
Width variation for different runner blocks on the same rail position	$△W_2$	10	20	30

Speed

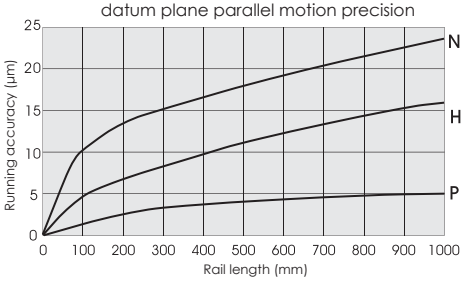
The maximum speed for the standard MR-SS/ZZ,SU/ZU type is:
Vmax = 3 m/s

Maximum acceleration
αmax = 250 m/s²
(If preload is at V0, capability of reaching 40m/s²)

The maximum speed for the standard MR-EE/EZ,EU/UZ,SUE/ZUE type is:
Vmax > 5 m/s

Maximum acceleration **αmax = 300 m/s²**
(If preload is at V0, capable of reaching 60m/s²)

Linear block relative to linear rail, datum plane parallel motion precision



MINIATURE LINEAR GUIDE SERIES MR

2. Technical Information

2.2 Preload

Preload

The MR Miniature Linear Guide series has three degrees of preload capacity: V0, VS and V1 (as described in the preload table below.) Appropriate preload levels can enhance the stiffness, precision, and torsion resistance performance of the linear guide. But an inappropriate application thereof can also negatively affect the product life and its motional resistance levels.

Table Preload

Preload type	Model code	Clearance (um)						Application
		3	5	7	9	12	15	
Clearance	V0	+3 – 0	+3 – 0	+4 – 0	+4 – 0	+5 – 0	+6 – 0	Very smooth
Standard	VS	+1 – 0	+1 – 0	+2 – 0	+2 – 0	+2 – 0	+3 – 0	Smooth and high precision
Light preload	V1	0 – - 0.5	0 – -1	0 – - 3	0 – - 4	0 – - 5	0 – - 6	High rigidity Minimizes vibration High precision Load balance

Operating Temperature

The MR Miniature Linear Guide can operate in a range of temperatures from -40ºC~ + 80ºC. For short term operation, it can reach up to +100ºC.

2.3 Lubrication

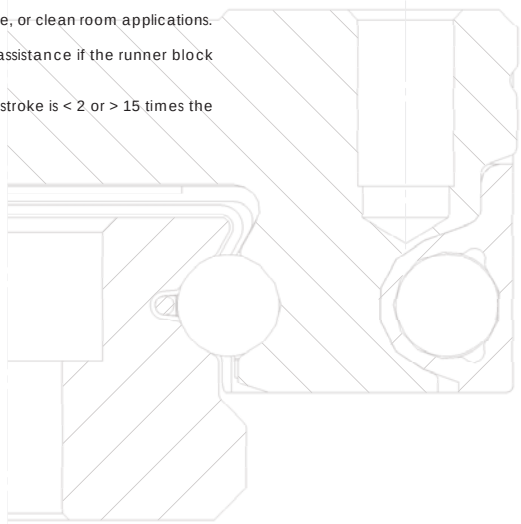
Function

When operating the linear guide under sufficient lubrication conditions, a one-micron layer of oil forms at the contact zone, separating the loaded rolling components and the raceway. Sufficient lubrication will:

- Reduce friction
- Reduce oxidation
- Reduce wear
- Dissipate heat and increase service life

Lubrication Caution

- ZZ/ZU/EZ/UZ/ZUE Lubrication Storage block
  1. The block already contains lubricants which can be directly installed on the machine, without the need for additional washing.
  2. When first washing the blocks, please do not soak them in the lubricant before both the detergent and cleaning naphtha within are totally dry. The block is ready for installation only after the lubrication storage is full of the lubricant.
- The linear guide must be lubricated for protection before first time use. Contaminants of any kind, weather liquid or solid, should be avoided.
- The runner block should be moved back and forth during lubrication.
- The lubricant can be added either manually or automatically directly onto the rail raceway.
- The lubricant can be injected into the lubrication holes on either end of the runner block.
- A thin layer of observable lubricant should be maintained on the surface of the rail .
- Re-lubrication must be completed before contamination or discoloration of the lubricant occurs.
- Please notify us if product is intended for use in acidic, alkaline, or clean room applications.
- Please contact our technical department for lubrication assistance if the runner block is intended for use in a wall mount configuration.
- The re-lubrication interval must be shortened if the travel stroke is < 2 or > 15 times the length of the steel body of the runner block.



Grease lubrication

When grease lubrication is applied, we recommend synthetic oil-based lithium soap grease with a viscosity between ISO VG32-100.

Oil lubrication

For oil lubrication, we recommend synthetic oils CLP, CGLP (based on DIN 51517) or HLP (based on DIN 51524) with a viscosity range of between ISO VG32-100 and a working temperature range between 0°C~+70°C. (We recommend ISO VG10 for use in lower temperature environments.)

2. Technical Information

2.3 Lubrication - continued

Re-lubrication

- Re-lubrication shall be applied before the lubricant in the block is contaminated or changes color.
- The amount of the lubricant applied should be 1/2 of the first lubrication. When applying lubricant, this should be done until it seeps out from the device.
- Re-lubrication shall be applied under steady operating temperature, with the runner block moved back and forth throughout for optimum distribution.
- If the stroke is smaller than twice or greater than 15 times the steel body length of the block, the re-lubrication interval shall be shortened.

Table 1

Model code	First lubrication (cm^3)	Model code	First lubrication (cm^3)
-	-	2 WL	0.03
3 MN	0.02	3 WN	0.03
3 ML	0.03	3 WL	0.04
5 MN	0.03	5 WN	0.04
5 ML	0.04	5 WL	0.05
7 MN	0.12	7 WN	0.19
7 ML	0.16	7 WL	0.23
9 MN	0.23	9 WN	0.30
9 ML	0.30	9 WL	0.38
12 MN	0.41	12 WN	0.52
12 ML	0.51	12 WL	0.66
15 MN	0.78	15 WN	0.87
15 ML	1.05	15 WL	1.11

Re-lubrication Interval

The re-lubrication interval depends on individual use, as the speed, load, stroke length and operating environment are all factors. Careful observation of rails and blocks is the basis to determine the optimal re-lubrication interval; as a rule of thumb, re-lubricate at least once per year. Do not apply water-based coolant liquid on the linear rails or slide. Inject lubricant through injection holes on both ends of the runner block with the recommended **cpc** brand injector.

Lubrication grease

00 For general applications
01 For low-friction, low-noise applications

2. Technical Information

2.4 Friction

Friction

The MR Miniature Linear Guide Series has low-friction characteristics with a stable and minor starting friction.

Sealing Design

The MR Miniature Linear Guide Series are enclosed by end seals on both ends of the runner block. Optional side seals can also create an all-around sealing system.

Friction

$$F_m = \mu \cdot F \quad \text{——(1)}$$

F Load (N)

F_m Friction (N)

The MR Miniature Linear Guide Series friction factor is app μ = 0.002~0.003

Friction Factors

- Sealing system.
- Collision between the balls during operation.
- Collision between the balls and the return path.
- Number of balls in the gothic arch load zone.
- Resistance from lubricant to ball pressure.
- Resistance caused by contaminants.

2.5 Load Capacity and Rating Life

Static Load Rating C_0

Measuring the static load of the travel force along the acting direction, the maximum stress between the rolling balls and raceway is as follows:

- If the curvature radius is lower or equal to 0.52: 4200 MP
- If the curvature radius is equal or higher to 0.6: 4600 MP.

Note: Under maximum stress levels, a permanent deformation will be generated at the contact point. This corresponds roughly to about 0.0001 times the rolling element diameter.
(The above is according to ISO 14728-2)

Static load safety factor calculation

$$S_0 = C_0 / P_0 \quad \text{——(11)}$$

$$S_0 = M_0 / M \quad \text{——(12)}$$

$$P_0 = F_{max} \quad \text{——(13)}$$

$$M_0 = M_{max} \quad \text{——(14)}$$

Operation condition	S_0
Normal operation	1 ~ 2
Load with vibration or impact	2 ~ 3
High accuracy and smooth running	≧ 3

Static load P_0 and moment M_0

The permissible static and applied static load of the MR Miniature Linear Guide Series is limited by:

- The static load of the linear guide.
- The permissible load of fixed screws.
- The permissible load for the connected parts of the mechanism.
- The static load safety factor required for the application.

The equivalent static load and static torque are the largest load and torque, please consult with formulas (13) and (14).

Static load safety factor S_0

In order for the linear bearing to permanently withstand potential deformation while delivering a guaranteed accuracy and reliable motion, the static load safety factor, So should be calculated with formulas (11) and (12).

S_0 static load safety factor
C_0 basic static load in acting direction N
P_0 equivalent static load in acting direction N
M_0 basic static moment in acting direction Nm
M equivalent static moment in acting direction Nm

2.5 Load capacity and rating life - continued

Dynamic load rating C_{100B}

For constant sized and directional loads, when the linear bearing is under such a load, the rating life of a linear guide can reach a theoretical travel distance of 100km. (The above is according to ISO 14728-1.)

Rating life calculation

$$C_{50B} = 1.26 \cdot C_{100B} \quad (2)$$

$$C_{100B} = 0.79 \cdot C_{50B} \quad (3)$$

$$L = \left(\frac{C_{100B}}{P}\right)^3 \cdot 10^5 \quad (4)$$

$$L_h = \frac{L}{2 \cdot s \cdot n \cdot 60} = \frac{L}{v_m \cdot 60} \quad (5)$$

L	=	rating life for 100,000 meter travel distance	(m)
L_h	=	rating life in hours	(h)
C_{100B}	=	dynamic load rating	(N)
P	=	equivalent load	(N)
s	=	length of stroke	(m)
n	=	stroke repetition	(min^{-1})
v_m	=	average speed	(m/min)

Rating Life L

90% survival rate for an individual linear guide or a batch of identical linear guides in standard product material and operation conditions is calculated as above (according to ISO 14728-1 standards). When using the 50km travel standard, the dynamic load rating will exceed the ISO 14728-1 standard value by 20% or more. Formula (2) describes the relationship between the two load ratings.

Calculation of rating life

Formulas (4) and (5) can be used when the equivalent dynamic load and the average speeds are constant.

Equivalent dynamic load and speed

If the load and speed are not constant, it is important to take into account the actual load and speed as both will influence life expectancy.

Equivalent dynamic load

If there is a change in load only, the equivalent dynamic load can be calculated according to formula (6).

Equivalent speed

If there is a change in speed only, the equivalent speed can be calculated according to formula (7).

If there are changes in both load and speed, the equivalent dynamic load can be calculated according to formula (8).

Equivalent load capacities and speed calculation

$$P = \sqrt[3]{\frac{q_1 \cdot F_1^{\,3} + q_2 \cdot F_2^{\,3} + \cdots + q_n \cdot F_n^{\,3}}{100}} \quad (6)$$

$$\overline{v} = \frac{q_1 \cdot v_1 + q_2 \cdot v_2 + \cdots + q_n \cdot v_n}{100} \quad (7)$$

$$P = \sqrt[3]{\frac{q_1 \cdot v_1 \cdot F_1^{\,3} + q_2 \cdot v_2 \cdot F_2^{\,3} + \cdots + q_n \cdot v_n \cdot F_n^{\,3}}{100\ \overline{v}}} \quad (8)$$

$$P = |F_X| + |F_Y| \quad (9)$$

$$P = |F| + |M| \cdot \frac{C_0}{M_0} \quad (10)$$

P	=	Equivalent dynamic load	(N)
q	=	Percentage of stroke	(%)
F_1	=	Discrete load steps	(N)
$\overline{v}$	=	Average speed	(m/min)
v	=	Discrete speed steps	(m/min)
F	=	External dynamic load	N
F_Y	=	External dynamic load, vertical	N
F_X	=	External dynamic load, horizontal	N
C_0	=	Static load rating	N
M	=	Static moment	Nm
M_0	=	Static moment in direction of action	Nm

Combined Equivalent Dynamic Load

If the linear guide bears the load from arbitrary angels so that the acting force does not conform to horizontal and vertical directions, its equivalent dynamic load is calculated as shown on formula (9).

Under the condition with the moment

If the linear guide bears the load and the moment simultaneously, its equivalent dynamic load is calculated with formula (10).
According to ISO 14728-1, when equivalent dynamic load tolerance rates below ≦ 0.5C, P ≦ C0m, a realiable product life value can be calculated.

Single Block Bearing the Moment

For a given structure, if the block needs to bear torque moments from Mp and My directions, the maximum moment that the block can withstand while still maintain smooth running conditions measures at about 0.3-0.1 times the static moment rating. The higher the preload, the higher the loading value and vice versa.

In the case of any design questions, please contact the **cpc** technical department.

2.6 Line chart

Under pressure

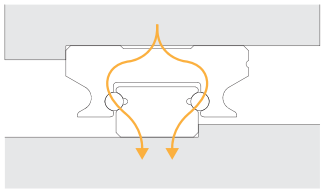

Figure A

Pull up

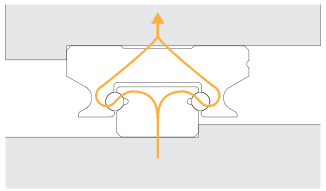

Figure B

Lateral force 1

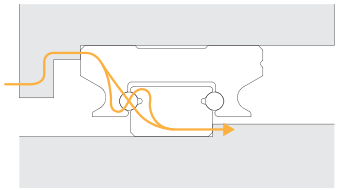

Figure C

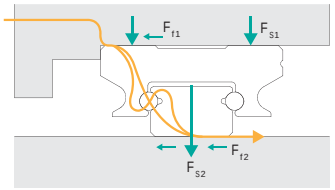
Lateral force 1



F_{S1}、F_{S2} : screw fixation

F_{f1}、F_{f2} : frictional resistance

$F_f = F_S \cdot \mu_0$

Figure D

As can be seen from the three diagrams in Figure A to Figure D, when subjected to upward, downward and lateral loads, the force flow will be distributed to the two ball transfer.

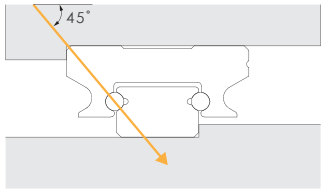


Figure E

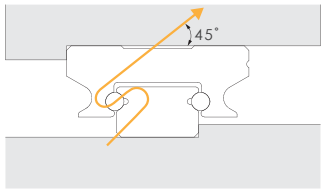

Figure F

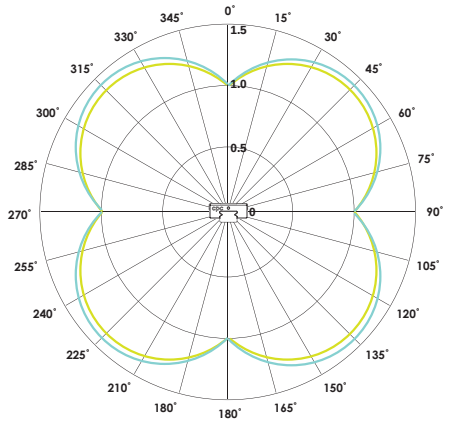
As shown in the two diagrams in Figures E and F, the load acting on the 45-degree angle has the greatest effect on the system's life because the transfer of force is limited to a single row of balls.

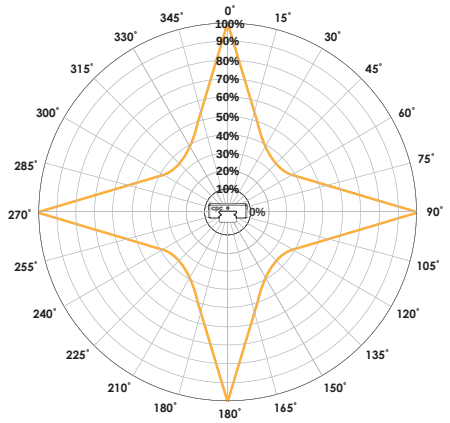
When the load is applied horizontally or vertically (0 °, 90 °, 180 °, 270 °), the equivalent load of the slide is equal to the actual load. When the load angle is 45 , its equivalent load is approximately 1.414 times that of the main direction. (as shown in formula (13))

When the same load is at different angles, the comparison of equation (13) and the actual equivalence load is as shown in the following figure.



Therefore, in order to increase the service life of the linear system, it should be installed in the appropriate direction to bear the load. Otherwise, the service life will be greatly reduced, as shown in the figure below. Since the relationship between life and load is as the power of formula (8), when the acceptance angle is 45°, the service life will be significantly reduced.

The following is the life L comparison chart (in %) for different angles under the same load.

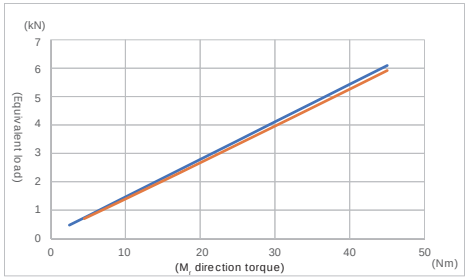


Equation (13) (Page 15) calculates the approximate value of the equivalent load

Actual equivalence load

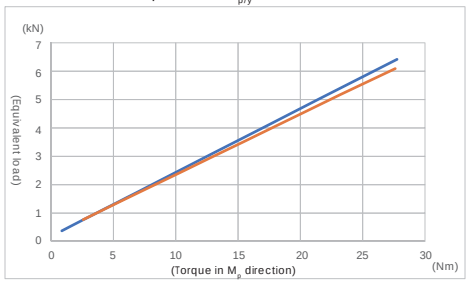
Ball

The following is a comparison diagram of the equivalent load approximate value and the actual equivalent load calculated by Equation (14). The example uses the MR15MN linear guide to withstand a fixed down pressure and the torque gradually increases. The above figure shows the torque in the Mr direction. The figure below shows the torque in the $M_{p/y}$ direction.



Equation (14) (Page 15) Calculate the approximate value of the equivalent load $\left|\frac{M_r}{M_{r0}}\right| \cdot C_0$

Actual equivalence load



Equation (14) (Page 15) calculates the approximate value of the equivalent load $\left|\frac{M_{p/y}}{M_{p0/y0}}\right| \cdot C_0$

Actual equivalence load

2. Technical Information

2.7 Loading, Lifetime, & Rigidity Analysis Software of Linear Guide System (LLRAS)

1. The load exert on the linear guide would varies due to the position of object's center of gravity, thrust position and acceleration / deceleration induced inertia.
2. Because of the uneven distribution of force on linear guide, when a certain part of rail, or when a force exertion point is damaged, the linear guide system would start to malfunction.
3. The point with largest force exertion must be identified, and be used reference to calculate the equivalent load, to ensure the reliability of service life calculation.

Ball

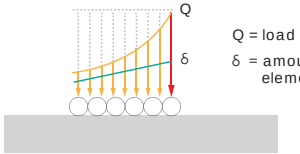
$$Q \propto F\left(Dw^{\frac{1}{2}}, \delta^{\frac{3}{2}}, C_{\delta}^{\frac{3}{2}}\right)$$

Q = load

δ = amount of rolling element deformation

Dw = ball diameter

C_{δ} = geometric constant



Q = load

δ = amount of rolling element deformation

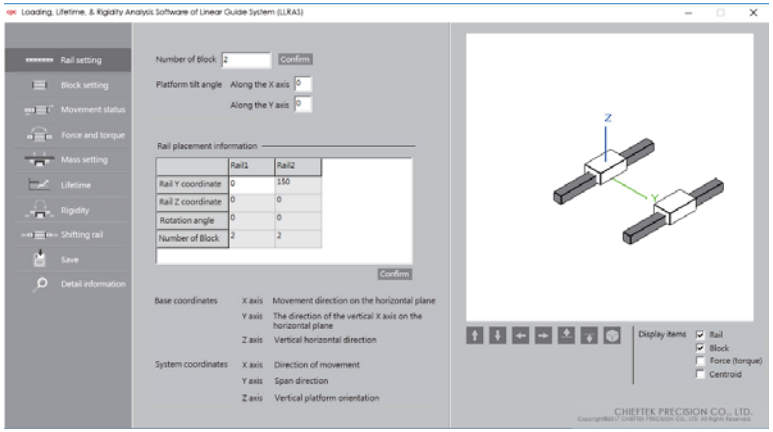
As shown by the formula, the relationship between the amount of deformation of the rolling element and load is not linear. A larger deformation will cause the non-linear increase of load.

Therefore by using the **cpc** self-developed program, the "Loading, Lifetime, & Rigidity Analysis Software of Linear Guide System (LLRAS)", a precise service life estimation can be derived. This is done by optimum calculation of deformation and rotation when a linear guide experience load, in this case the accurate equivalent load can be calculated.

Loading, Lifetime, & Rigidity Analysis Software of Linear Guide System (LLRAS)

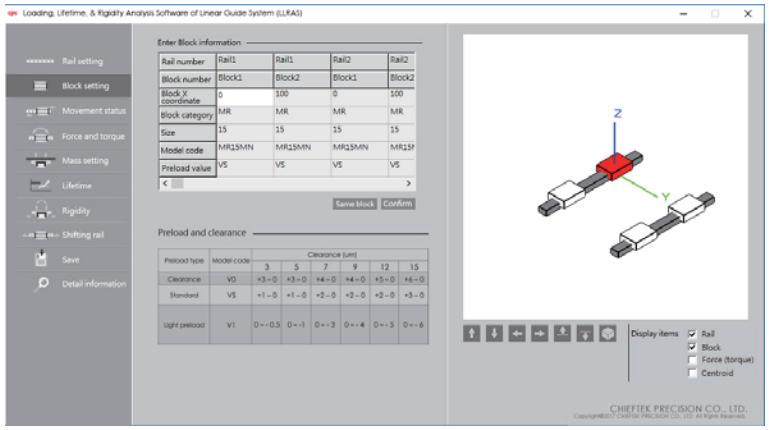
Data input guidance

1. Set the slide rail position, the number of slides on the slide



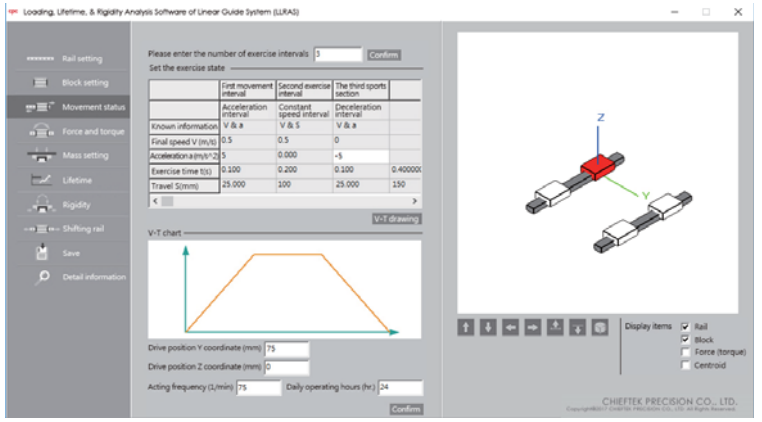
Variables can be set:
- Linear guide span
- Linear guide height
- Linear guide placement angle
- Platform inclination
- Number of block

2. Set the carriage size model



Variables can be set:
- Block span
- Block type
- Block preload

3. Set the exercise state



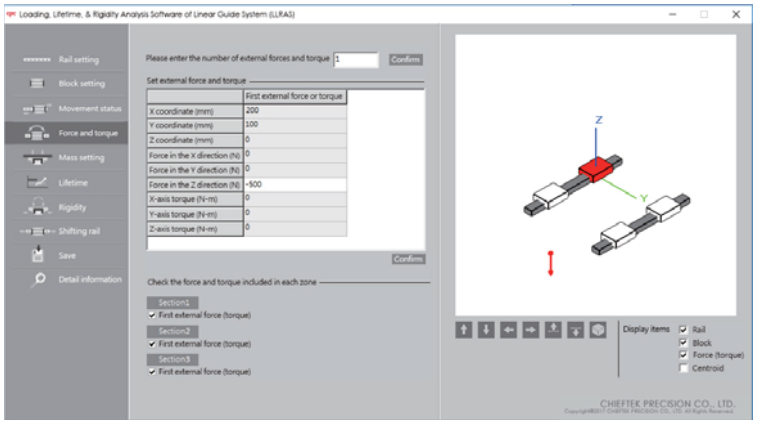
Variables can be set:
- Working status
- Drive position
- Actuation frequency

MINIATURE LINEAR GUIDE SERIES MR

2. Technical Information

2.7 Loading, Lifetime, & Rigidity Analysis Software of Linear Guide System (LLRAS)

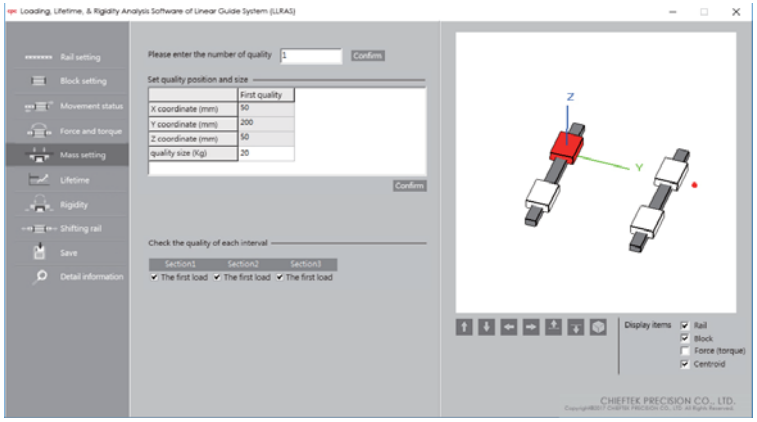
4. Set external force and torque position, size, direction



Variables can be set:

- External force (torque) intensity
- External force (torque) position
- External force (torque) working zone

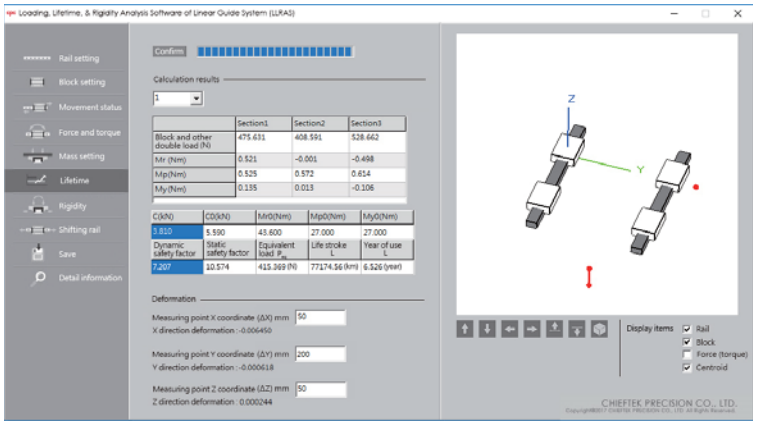
5. Set the quality position size



Variables can be set:

- Center of gravity position
- Center of gravity dimension
- Load range

6. The calcualted results and setting of linear guide system



The calculation results are shown in the figure, and the information such as force and equivalent load P_{eq}, dynamic safety factor S, static safety factor S_0, and lifetime L(km/year) of each section can be obtained, and the deformation of any measured point can also be obtained.*

This program can be used to calculate the installation and dimension design of various linear slide rails under different load and movement conditions. The obtained information such as deformation amount, force distribution, and life span can help to provide appropriate and correct design recommendations.

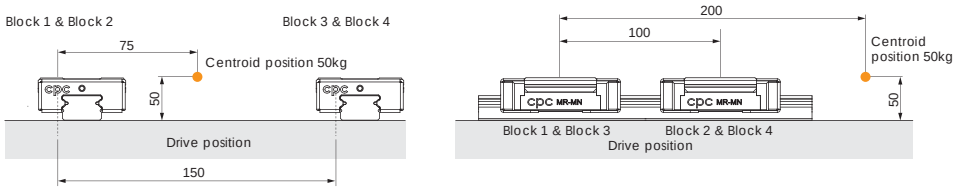
* For the calculation of amount of deformation, only the rolling object is considered. For actual deformation the steel body of block must be considered as well. When the load > 20% C0, the actual deformation is 1.5 times larger than calculated deformation. When Load = C0, the actual deformation is 2~2.5 times of calculated deformation.

* If there is any information needed, please contact R&D department.

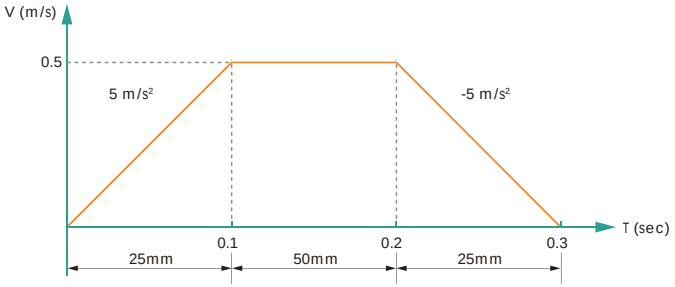
2. Technical Information

Application Example

Using the MR 15 MN VS block, the schematic diagram of the mechanism is as follows:



Motion status is as follows



cpc

Unit:N

	Block 1	Block 2	Block 3	Block 4
At acceleration	261.2	536.1	261.2	536.1
At constant velocity	344.4	619.4	344.4	619.4
At deceleration	427.4	702.5	427.4	702.5
Average load	354.3	625.4	354.3	625.4

Traditional calculated results obtained by geometric distribution.

Unit:N

	Block 1	Block 2	Block 3	Block 4
At acceleration	183	432	183	432
At constant velocity	246	495	246	495
At deceleration	309	558	309	558
The maximum value of average load	499			

Results calculated by program

In this case, the calculated result of equivalent load is 25% higher than result obtained by traditional geometric distribution method, and the service life is about 2 times different.

If there is a demand for life and rigidity calculation, please fill in form of【Linear guide service life calculation and model selection】and contact **cpc** technical department.

3. Insstallation Illustration

Height and chamfer of reference edge

To avoid interference, the corner of the reference edge should have a chamfer. If not, please refer to the following table for the height of the reference edge corner and the height of the reference edge.

The mounting surface

The mounting surface should be ground or fine milled to reach a surface roughness of Ra1.6 μm.

3. Insstallation Illustration

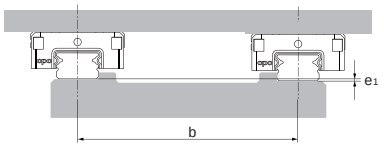
Geometric and positional accuracy of the mounting surface

Inaccurate mounting surfaces will affect the operational accuracy of the linear guide when the mounting surface height differential is greater than the values calculated by formulas (15), (16), and (17). The rating lifetime will also be shortened.

(15) $e1\ (mm) = b\ (mm) \cdot f1 \cdot 10^{-4}$

(16) $e2\ (mm) = d\ (mm) \cdot f2 \cdot 10^{-4}$

(17) $e3\ (mm) = f3 \cdot 10^{-3}$



Reference edge

Rail: Both sides of the track rail can serve as the reference edge without any special marking.
Block: Reference edge is opposite to the groove marking side.

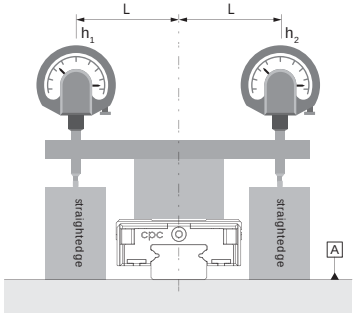
Rail installation

Diagram	Description	Feature
	· No Straightening · Not allowed	No precision Low lateral bearing capacity
	· Straightening by pin · Not suggested	Low precision Low lateral bearing capacity
	· Straightening based on straight edge, calibrated by meter	Low to mid precision Low lateral bearing capacity
	· Place the rail on a supporting edge (Precision vise applied)	High precision One side with high lateral bearing capacity
	· With support edge and lateral mounting screw	Very high precision High lateral bearing capacity on both sides.

Recommended precision measurement method

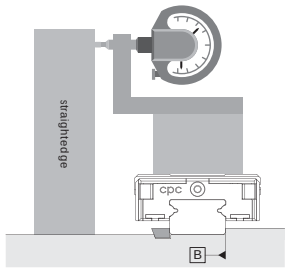
The working accuracy of linear guide is defined by the parallelism between block and rail(height, side). In practical application the linear accuracy is required, the measuring method is diverse, so we would suggest following measure to acquire the linear accuracy of linear guide.



H The horizontal working accuracy // P +
base plane flatness ▱ A = $|h_1-h_2|_{\text{total length}}$

(above mentioned method can be used to exclude the skew error of rail on roll direction)

* When the error of flatness of base plane is 0, the value is the linear working accuracy of rail at the certain height
(Please refer to table of working precision page 07)



W_2 The horizontal working accuracy // P +
the straightness of rail installation — B

*When the error of the straightness of the rail is 0, the value is the horizontal working accuracy on the side.
(Please refer to table of working precision page 07)

4. Ordering Information

Length of Rail

Butt-jointing is required when lengths exceed Lmax.
(For more detailed information, please contact **cpc** for technical support.)

Customization Requirement

The meaning of suffix characters:

- J ：slide rail connection
- G ：customer designated lubricant
- I ：with Inspection report
- R ：special process for rail
- B ：special processing for block
- S ：special straightness requirements for rail
- C3 ：Cap M3
- C4 ：Cap M4
- MS ：Metal Stopper on stainless steel Rail

J：slide rail connection

When the required length of rail exceeds the standard rail length, a butt-joint can be specified. The rail butt-joint indication is marked as illustrated below.

B：special processing for block

For special process requirements, please contact technical support.

I ：with Inspection report

Please contact technical support.

S ：special straightness requirements for rail

The straightness of the linear guide rail is specially calibrated by precision fine grinding.

MS：Metal Stopper on Stainless Steel Rail

1. To prevent the block from separating from the rail during transportation or installation; this may cause item damage or scattering.
2. Perfect for rails installed on the vertical axis (Z-axis) to prevent gravity induced block separation from the rail.
3. The stoppers and screws are made of stainless steel material with an anti-corrosion function.
4. Strongly recommended NOT to use as a mechanical travel limiter or breaking system.

R ：special process for rail

For special process requirements, please contact technical support.

G ：customer designated lubricant

According to application environment.

GN ：no lubricant

GC ：low dust generation

Suitable for clean room environments.

C3 CapM3 ：

Applies to MR9M, MR12M, MR15M, MR7W & MR9W rails.

C4 CapM4 ：

Applies to MR12W, MR15W rails.

Dimension

6. Carbon Steel

Characteristic

1. Provided max length: 3m.
2. Hardness of the ball runner rail surface：HRC 58 ~ 63
   Hardness of the center：About HRC 28
3. Applies to industrial machines in normal conditions.
4. Sizes are the same as with stainless steel products.
5. Very competitive prices.
6. Precision class available for N, H, and P Grade.
7. Product size, precision class, and other technical information are the same as the MR stainless series, please refer to the cpc MR Miniature Linear Guide Series Catalog for more information.

ST MINIATURE STROKE SLIDE SERIES

1. Product Introduction

High load and high moment capaity

The ST Miniature Stroke Slide Series is designed with two rows of balls. The ball track has a gothic profile design with a 45 degree contact angle to achieve equal load capacity in a mono block. This provides more space for the larger rolling elements while enhancing the load and moment capacity.

High running accuracy and smoothness

The steel balls of the ST miniature stroke slide series roll on the rail without recirculation, resulting in excellent running behavior, smoothness, low friction, and high accuracy without vibration.

Dual plate design

The ST Miniature Stroke Slide Series adopts a pair of end plates into the design. Both the center rail and bearing block sides have a plate installed that prevents the linear guide from over-stroking.

Easy mounting

The mounting of the ST Miniature Stroke Slide Series is accomplished by fitting the fixing screw downward into the count bore of the rail by intersecting the hole pattern on the block and cage within the hole pitch. The one piece cage therefore does not influence the mounting of the rail while the preload is preset by ball sorting.

Temperature

The ST Miniature Stroke Slide Series can withstand temperatures of up to 150 °C. There are two treatment options for higher temperature applications:

T1：200°C
T2：300°C

Applying treatments for higher temperature applications will reduce the load capacity.

Anti-corrosion feature

The ST Miniature Stroke Slide Series is composed of quenched hardened process stainless steel for the rail, block, and steel balls. The block plate and screws are made of stainless steel as well -- providing a great model for maintenance and inspection applications.

2. Technical Information

Accuracy

The ST Miniature Stroke Slide Series has three grades for accuracy. Precision (P), High (H) and Normal (N).

Preload

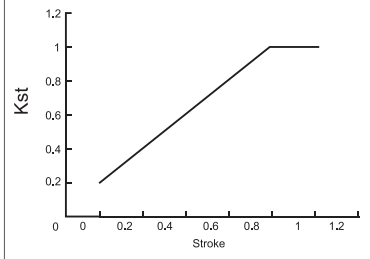
The ST Miniature Stroke Slide series has two preload classes, V0 and V1, as described in the MR miniature linear guide series preload table.

Rating life calculation

$$L = K_{st}\left(\frac{C_{100B}}{P}\right)^3 \cdot 10^5 \quad \text{——(19)}$$

$$L_h = \frac{L}{2 \cdot s \cdot n \cdot 60} = K_{st} \cdot \frac{L}{v_m \cdot 60} \quad \text{——(20)}$$

Short stroke factor diagram



According to ISO14728-1 short stroke factor

Lubrication

Lubrication of the ST Miniature Stroke Slide Series can be performed by adding the lubricant onto the raceway of the rail.

Rating life L

The rating life of the ST Miniature Stroke Slide Series can be calculated by formulas (19) and (20), in accordance with ISO 14728-1.

Geometric and positional accuracy of the mounting surface

The inaccuracy of the mounting surfaces will affect the running accuracy and reduce the operating lifetime of the ST Miniature Stroke Slide. If the inaccuracies of the mounting surface exceed the values calculated by formulas (15), (21), and (17), the lifetime will be shortened, as calculated by formulas (19) and (20).

$$e_{1(mm)} = b_{(mm)} \cdot f_1 \cdot 10^{-4} \quad \text{——(15)}$$

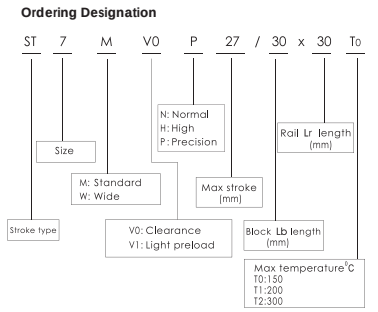
$$e_{2(mm)} = \left(\frac{d_{(mm)}}{Lc_{(mm)}}\right) \cdot f_2 \cdot 10^{-5} \quad \text{——(21)}$$

$$e_{3(mm)} = f_3 \cdot 10^{-3} \quad \text{——(17)}$$

The mounting surface geometric and positional accuracy factor

Size	V0			V1		
	f_1	f_2	f_3	f_1	f_2	f_3
7	5	200	4	3	130	3
9	5	300	6	4	200	4
12	6	380	8	4	250	6
15	7	530	12	5	350	8

Ordering designation



Height and Chamfered Reference Edge

The tables for the chamfered reference edge corner and the height of the reference edge for the MR Miniature Linear Guide Series are also suitable for the ST Miniature Stroke Slide Series.

3. Ordering Information

An example of the ST Miniature Stroke Slide Series part numbering system is shown above.

ST MINIATURE STROKE SLIDE SERIES
